                                                                                                                                                   The present sequence represents a Monkey antibody light chain linked to a heavy chain. The antibody binds to a target structure displayed in and on a subpopulation of horman gastrointestinal epithelial tumour cells and in target structure especially comprises alpha6beta4 integrin. The target structure especially comprises alpha6beta4 integrin. This is a tumour-associated antigen. The antibody, and its fragments, are useful for treating conditions based on anti-angiogenic mechanism in humans. They are useful for treating human metastatic and malignant disease, for in vivo diagnosis and prognosis of human malignant disease, for comprising tumour typing, tumour screening, tumour diagnosis and prognosis and monitoring premalignant conditions. Quantitative in vivo diagnosis as carried out by determining the localization of antibody to

The present invention relates to human antibodies, or their antigen-binding fragments, that selectively bind to a human interleukin-21 receptor (IL-21R). The antibodies of the invention are referred to as WUF, WUF-germline, WUI, 1864, 1885, 1985, CP5G2 and R18. The antibodies selectively bind the extracellular domain of human IL-21R, or inhibit the binding of IL-21 to an IL-21R. Pharmaceutical compositions comprising an antibody or fragment of the invention are useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis, inflammatory bowel disease, Crohn's disease, transplant rejection or psorianis) or hyperproliferative disorders. The present sequence is an anti-IL-21R antibody light chain complementarity determining region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.
New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunosuppressive, Cytostatic, Antirheumatic, Antiarthritic, Antiinflammatory, Gastrointestinal; Antipsoriatic, Gene therapy; antibody, interleukin-21 receptor; interleukin-21; receptor; IL-21; interleukin-21; autoimmune disorder; rheumatoid archritis; inflammatory bowel disease; Crohn's disease; transplant rejection;

                                                                                                                                                                                                                                                         ò
                      The present invention relates to human antibodies, or their antigen-
binding fragments, that selectively bind to a human interleukin-21
receptor (IL-2IR). The antibodies of the invention are referred to as
WUF, MUF-germline, MU1, 1864, 1875, 1975, CP5G2 and R18. The antibodies
selectively bind the extracellular domain of human IL-2IR, or inhibit the
binding of IL-2I to an IL-2IR. Pharmaceutical compositions comprising an
antibody or fragment of the invention are useful for diagnoshing,
preventing or treating autoimmune disorders (e.g. rheumatoid arthritis,
inflammatory bowel disease, Crohn's disease, transplant rejection or
psoriasis) or hyperproliferative disorders. The present sequence is an
anti-IL-2IR antibody light chain complementarity determining region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Recombinant anti-rhesus D monoclonal antibody - expressed by baculovirus-transformed insect cells and useful for preventing haemolysis in new-born babies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human monoclonal antibody; immunoglobulin isotype IgM; agglutination; rhesus positive; rhesus negative; haemolysis; lambda light chain; variable region; insect host cell; baculovirus; recombinant production.
                                                                                                                                                                                                                                                         Gaps

The human monoclonal antibody D7C2, of isotype IgM, recognises a 30-32 kD polypeptide on the membrane of rhesus positive red blood cells. The antibody agglutinates rhesus positive cells but not rhesus negative cells and is useful diagnostically and also for preventing haemolysis in newborn rhesus positive babies. Recombinant IgM-D7C2 can be produced by born rissect cells which have been transformed by a baculovizal vector comprising a D7C2 expression cassette. The present sequence is that of the variable region of the IgM-D7C2 light chain
                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         binding fragments, that selectively bind to a human interleukin-21 receptor (IL-21R). The antibodies of the invention are referred to as MUF, MUF-germline, MUI1, 18G4, 18A5, 19F5, CPSG2 and R18. The antibodies selectively bind the extracellular domain of human IL-21R, or inhibit the binding of IL-21 to an IL-21R. Pharmaceutical compositions comprising an antibody or fragment of the invention are useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human antibodies, or their antigenbinding fragments, that selectively bind to a human interleukin-21 receptor (IL-2IR). The antibodies of the invention are referred to as WUF, WUF-germline, WU11, 1864, 18A5, 19F5, CP5G2 and R18. The antibodies selectively bind the extracellular domain of human IL-2IR, or inhibit the antibody of IL-21 to an IL-2IR. Pharmaceutical compositions comprising an antibody or fragment of the invention are useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis, inflammancory bowel disease, crohn's disease, transplant rejection or psoriasis) or hyperproliferative disorders. The present sequence is an anti-IL-2IR antibody light chain variable domain (VL) of the invention.
inflammatory bowel disease, Crohn's disease, transplant rejection or psoriasis) or hyperproliferative disorders. The present sequence is an anti-IL-21R antibody light chain variable domain (VL) of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.

The antibody agglutinates rhesus positive cells but not rhesus negative cells and is useful diagnostically and also for preventing haemolysis in newborn rhesus positive babies. Recombinant IgM-D7C2 can be produced by comprising a D7C2 expression cassette. The present sequence is that of a recombinant IgM-D7C2 lambda light chain fused downstream of a signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant anti-rhesus D monoclonal antibody - expressed by baculovirus-transformed insect cells and useful for preventing haemolysis in new-born babies.
                                                                                                                                                                                                                                                                                                                                        20. .238

regeneration IV (Reg IV) protein. The invention specifically comprises the amino acid and coding sequences of single chain antibody fragments (scFv's) that bind Reg IV protein. The antibody of the invention is useful for treating, preventing and ameliorating: inflammatory bowel disorders (e.g. ulcerative colitis or Crohn's disease), diabetes (e.g. non-insulin dependent diabetes or insulin dependent diabetes), and cancer of the gastrointestinal tract. The antibody of the invention is also useful for detecting the expression of a Reg IV protein. The present amino acid sequence represents an scFv of the invention.
                                                                                                                                                                                                                                                                                                                             antibody; regeneration IV; Reg IV; single chain antibody fragment; scFv; inflammatory bowel disorder; ulcerative colitis; Crohn's disease; diabetes; non-insulin dependent diabetes; insulin dependent diabetes;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antibody, useful for treating, preventing or ameliorating inflammatory bowel disorder, cancer of the gastrointestinal tract or diabetes (non-insulin dependent diabetes).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to human antibodies, or their antigen-binding fragments, that selectively bind to a human interleukin-21 receptor (IL-21R). The antibodies of the invention are referred to as WUF, WUF-germline, MUI, 1864, 1875, 1975, CP5G2 and R18. The antibodies selectively bind the extracellular domain of human IL-21R, or inhibit the binding of IL-21R on IL-21R. Pharmaceutical compositions comprising an antibody or fragment of the invention are useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis, infammatory bowel disease, Crohn's disease, transplant rejection or psoriasis) or hyperproliferative disorders. The present sequence is an anti-IL-21R antibody scrv domain of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.

The present invention relates to human antibodies, or their antigen-
binding fragments, that selectively bind to a human interleukin-21
receptor (IL-21R). The antibodies of the invention are referred to as
MUF, MUF-germline, MUI1, 1864, 1845, 19F5, CP562 and R18. The antibodies
selectively bind the extracellular domain of human IL-21R, or inhibit the
binding of IL-21 to an IL-21R. Pharmaceutical compositions comprising an
antibody or fragment of the invention are useful for diagnosing,
preventing or treating autoimmune disorders (e.g. rheumacoid arthritis,
inflammatory bowel disease, Crohn's disease, transplant rejection or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human antibodies that selectively bind to human interleukin-21 receptor, useful for diagnosing, preventing or treating autoimmune disorders (e.g. rheumatoid arthritis) or hyperproliferative disorders.

This polypeptide sequence comprises the VL domain of human scFv antibody 1046, which is specific for transforming growth factor (TGF) beta-1. It is encoded by a gene (AAT60384) isolated from a peripheral blood lymphocyte library. The antigen-binding domains of human antibodies (see AAM15522-40) to TGF beta-1 and/or beta-2 can be used to counter the adverse effects of TGF beta, such as (i) promotion of fibrosis (in dermal, ocular or keloid scarring, lung fibrosis, arterial injury, proliferative retinopathy, retinal detachment, adult respiratory distress syndrome, liver cirrhosis, post myocardial infarction, post-angioplasty cestenosis, acleroderma, vascular disorders, cataract, glaucoma, or esp. neural scarring and glomerulonephritis, also (not claimed) osteoporosis), continue and inflammatory diseases (e.g. rheumatoid arthritis, macrophage deficiency diseases or macrophage pathogen infection). Nucleic acids encoding human antibody VW and VL can be used for prodn. of recombinant antigen-binding domains. These are highly specific, have low diseasch in the constants (pref. less than 5 mM) and low IC50s for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Agent contg. antigen-binding domain of human antibody to transforming growth factor beta 1 or 2 - and nucleic acid encoding it, used to neutralise effects of TGF, e.g. for control of fibrosis, immune and

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Claim 1; Page 2228-2229; 3148pp; English

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TMP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the antibodies and fragments of the antibodies described in the method of associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and the invention ABP45519

WPI; 2003-505530/47.

Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.

Example 1; SEQ ID NO 1530; 394pp; English.

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 19434 and encodes a protein that is a member of the tumour chromosome lagat and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrws) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods correctly and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders only astheria gravis and multiple sclerosis, inflammatory disorders e-g. asthma and rheumatoid arthritis, infectious diseases such as ALDS and proliferative disorders including leukaemia, carcinoma and lymphoma. Accordingly, they can be described as exhibiting various continining and antisheumatic, antialrenthritic, neuroprocective, antianthreumatory, antisathmatic, antialrenthritic, neuroprocective, antianthrial and orthory antisathmatic, antialery of the polypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTS: The sequence data for this patent did not form part of inventions. in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences the printed specification, but was obtained

This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to chromosome 1943 and encodes a protein that is a member of the tumour necrosis factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrve) derived, prefersably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The from the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leaving in a sectionma and multiple collections or continued and multiple leaving in the continued and proliferative disorders including leaving in the continued and multiple collections are not continued and multiple collections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       lymphoma. Accordingly, they can be described as exhibiting various activities such as antirheumatic, antiarthritic, neuroprotective, antiarthritic, neuroprotective, antiarthritic, neuroprotective, antiarthritic, neuroprotective, polypeptide sequence is a single chain antiabody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directely from WIPO at ftp.wipo.int/pub/published pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           89.5%; Score 51; DB 7; Length 242; 81.8%; Pred. This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell to proliferation and differentiation. The antibodies of the invention have cytostatic, immunospensive, immunostimulant, immunomodulatory, antirheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and activity such as cancer, immune, and autoimmune disorders and ciseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (ADDS)). ABR43990-ABR4722B represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Genome Biol. 3:RESEARCH0080.1-RESEARCH0080.8 (2002).

-I- FUNCTION: Involved in the biosynthesis of L2/HNK-1 carbohydrate epitope on bort glycolipids and glycoproteins. Shows strict specificity for Gal betal-331 betal-4XJ, exhibiting negligible incorporation into other galactoside substrates.

-I- CATALYTIC ACTIVITY: UDP-glucuronate + 3-beta-D-galactosyl-4-beta-D-galactosyl-0-beta-D-galactosyl-4-beta-D-galactosyl-0-beta-D-galactosyl-4-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-galactosyl-0-beta-D-

-1- SUBUNIT. Monomer (By similarity).
-1- SUBCELLUTAR LOCATION: Cytoplasmic.
-1- SIMILARITY: Belongs to class-I aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          symbiotic bacterium).

-!- FUNCTION: Light-harvesting photosynthetic bile pigment-protein from the phycobiliprotein complex. Allophycocyanin has a maximum absorption at approximately 650 nanometers.
-!- SUBGNUT: Heterodimer of an alpha and a beta chain.
-!- PTM: Contains one covalently linked bilin chromophore.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
